

AI INTERNSHIP ASSIGNMENT

Product Review, AI Opportunity Analysis & Improvement Recommendations

Prepared by: Aditi Sharma

Program: MCA — Artificial Intelligence & Machine Learning

Institution: Uttaranchal University

This assignment reviews the digital and AI-oriented initiatives referenced in the internship brief and identifies practical opportunities to improve their user experience, personalization, AI capability, and measurable business impact. The analysis focuses especially on the Colour Analysis AI and Zenith Fashion areas highlighted in the brief.

Assignment Objective

Evaluate the referenced platforms from a product and AI perspective and propose improvements that are practical, user-centred and measurable.

Scope note: The internship brief specifically identifies Colour Analysis AI and Zenith Fashion as in-house systems; these are treated as priority areas. Publicly visible information and proposed recommendations are kept distinct.

1. Product & Platform Review

Zenith positions itself at the intersection of content, code and culture, with a strong Gen-Z orientation. Its public company profile also describes an emphasis on building platforms and communities rather than only campaigns.

■cite■turn4search1■

Product / Platform	Understanding	AI / Product Opportunity
Zenith	A culture-first, technology-driven creative platform positioned around content, code, culture and Gen Z. Its public company profile describes an emphasis on building platforms and communities rather than only campaigns.	AI-assisted fashion, trend intelligence, personalization, content generation, product testing and analytics.
J.E.R.K.	A fashion-focused initiative associated with the Zenith ecosystem. The internship brief specifically asks applicants to review its site/social presence and consider its AI/fashion direction.	AI styling, colour-aware recommendations, outfit matching, trend prediction and personalized fashion discovery.
MusicLabel AI	An AI-focused music initiative listed alongside Zenith's other emerging AI products.	AI-assisted music workflows, creator tools, music discovery, metadata generation and audience analytics.
AI Insight	An AI-skills / AI-literacy platform. Its public positioning emphasizes learning how to work with AI intentionally, including prompt engineering and practical AI skills.	Personalized learning paths, skill assessment, AI-use analytics, role-based recommendations and project-based learning.
AI4Education	An AI-in-education initiative focused on AI literacy, workshops, consulting and practical adoption for educators, students and educational organizations.	Adaptive learning, AI tutors, personalized practice, teacher assistants, progress analytics and responsible-AI guidance.

AI4Education focuses on practical AI adoption through AI-literacy facilitation, workshops and consulting. Its public materials include student AI exploration and innovation programs and custom AI solutions for educational organizations.

2. AI Feature Review & Improvement Proposals

Priority focus: Colour Analysis AI and Zenith Fashion

The strongest opportunity is to connect AI outputs to actions. A colour-analysis result can become the first step of a personalized styling journey, while fashion discovery can incorporate preferences, occasion, wardrobe and feedback.

Area	Recommended Improvement	Potential AI / Technical Approach
Colour Analysis AI	Move from a one-time colour result to an interactive personal styling assistant. Show confidence, explain why colours are recommended, and allow users to compare colours and save a personal palette.	Face/skin-region detection → colour-space analysis (Lab/HSV) → undertone/season classification → recommendation engine. Add calibration guidance to reduce effects from lighting and camera white balance.
Zenith Fashion	Combine colour analysis with outfit, occasion, season and style preferences. Let users upload an outfit and receive coordinated colour/style suggestions.	Computer vision + image embeddings + recommendation system. Detect garment categories/colours and rank compatible combinations.
J.E.R.K. Fashion Discovery	Create a personalized feed instead of a generic catalogue: users can select style preferences and receive explainable recommendations.	Content-based + collaborative filtering, trend signals, embeddings and user feedback loops.
MusicLabel AI	Add creator-focused tools such as mood/tag generation, track metadata assistance, similarity search and audience-oriented content suggestions.	Audio embeddings, NLP/LLM metadata generation, semantic search and analytics dashboards.
AI Insight	Use a short diagnostic assessment before recommending learning content. Track skill growth rather than only course completion.	Skill graph + recommendation engine + retrieval-augmented learning assistant + progress analytics.
AI4Education	Provide role-specific AI journeys for teachers, students and school leaders, with measurable before/after outcomes and safe-use guidance.	Adaptive learning paths, retrieval-augmented assistant, rubric-based feedback, dashboards and human-in-the-loop controls.

Recommended AI pipeline

User Image → Quality/Lighting Check → Face/Garment Detection → Feature Extraction → AI Classification → Personalized Recommendation Engine → Explainable Results → User Feedback → Continuous Improvement.

Implementation considerations: lighting/camera guidance; confidence or uncertainty indicators; diverse-condition testing; privacy-aware image retention; and user feedback loops.

3. Proposed Contribution & Work Sample

AI-Based Object Detection and Localization

AI-Based Object Detection and Localization — A computer-vision project using deep learning/object detection to identify everyday objects from images or video. The project demonstrates practical work with Python, YOLO-based detection, dataset preparation/annotation, model training and evaluation.

The project demonstrates practical computer-vision experience: problem definition, data preparation/annotation, YOLO-based deep learning, training, evaluation and thinking about image/video deployment. This problem-solving process is transferable to fashion vision, visual search and other AI product use cases.

Potential extension toward fashion products

Computer vision can support garment detection, colour extraction, outfit matching, visual search and recommendation. A user could upload a shirt image and receive matching palettes or outfit combinations, with feedback used to improve relevance.

4. Prioritized Roadmap

Priority	Feature	Expected impact
P0	Improve Colour Analysis with calibration, explainability and saved personal palette	Higher trust and repeat usage
P0	Connect Colour Analysis → Outfit Recommendations	Turns a single feature into a user journey
P1	Visual outfit search and garment/colour detection	More useful fashion discovery
P1	Personalized recommendations using feedback	Better relevance and retention
P2	Trend analytics and creator/brand insights	Business intelligence and differentiated product value

5. Conclusion

The strongest opportunity across these initiatives is to turn individual AI features into connected, measurable user journeys. For fashion, this means moving from colour detection to personalized styling; for education, from generic AI awareness to adaptive skill development; and for music, from isolated generation to creator workflow support and analytics. I would prioritize explainability, user feedback, privacy, bias testing, evaluation metrics and simple interfaces so that AI creates a visible improvement rather than becoming a feature added only for novelty.
